

2024 A Great Earthquake

In early January of 2024, Cap sat in her office looking over her notes. If she were correct, then the earthquake would be next.

Cap read a quote from Julie Jahenny about people being thrown 300 steps. Jahenny was a French mystic and stigmatist who lived from 1850 to 1941. "The earth will shake from this place until sunrise, the space of six days. A day of rest and on the eighth day, the trembling will begin again. France and England will respond with their cries of despair. The land will shake so hard that the people will be thrown up to 300 steps. The thunder will sound more brightly than in the months that will lead up to the end of the world, with a strange noise."ⁱ

Cap reread Apocalypse Eight. There was something about Chapter Eight which she liked in spite of all the trouble it foretold. It was as if it provided her with a friendly spirit who would guide her and help her understand the upcoming events. She told a friend that it consoled her to read Chapter Eight. One, it is consoling to hear something which rings true. And second, a known event is less terrifying than an unknown event.

The friend said that she would prefer not to know.

The Seventh Seal.

When the Seventh Seal was opened, the angel who stands at the altar of God took the golden censer, filled it with fire from the altar, and hurled it on the earth; after the thunder and lightning, there came an earthquake. When Apocalypse spoke about an earthquake, it spoke of an earthquake which was visible across a stretch of two thousand years. It meant an earthquake greater than all the others. An earthquake which stood alone without comparison, across two thousand years of history. An earthquake which was worthy of the name, act of God. When it arrived, it would be called the Great Earthquake.

When Cap started looking into the prophetic literature, she was surprised at the amount of material which spoke of a large earthquake. All the way back to Ezekiel, who said that every wall will collapse and every monument fall down. ⁱⁱ

The Cloud continues

Over the later part of 2023, the nuclei shower continued at a lower level. It was estimated that it might continue for a year. There was a diversity of opinion in the astronomical community, but the most common opinion was that we were passing through a larger but more diffuse cloud of fine particles. At night in a dark room, one could see little pinpricks of light. There was enough activity to create occasional dense clouds, lightning and thunder.

Early in 2024, there was an unexpected uptick in storm activity. More clouds and more lightning. Life went on as normal, but an unrelenting influx of electrons began to fill the magnetosphere with charge. The earth was passing through a river of current that ran across the galaxy. The effect of the solar system was to gather it into ribbons of greater concentration. The charges were slowly reaching a tipping point at which the rotation of the earth would be affected. *Comet and Earthquake*

From among her papers, Cap picked up a prophecy of St Hildegard.

“Before the comet comes, many nations, the good excepted, will be scourged by want and famine. The great nation in the ocean that is inhabited by people of different tribes and descent will be devastated by earthquake, storm, and tidal wave. It will be divided and, in great part, submerged. That nation will also have many misfortunes at sea and lose her colonies. All coastal cities will live in fear, and many of them will be destroyed by tidal waves.”

Pope Benedict declared Hildegard a doctor of the church. Benedict was a master of Romanita, the Roman art of understatement and nuance. By making Hildegard a doctor, he added credibility to this her most famous prophecy. Benedict was giving away part of the secret.

As Cap saw it, that short prophecy neatly described the effects of a Great Earthquake on America. Cap thought through the logical effects of a large earthquake:

The food production system will be shredded. Crops will not get to market.

Earthquakes will crumble the urban landscape.

Storms will tear across the countryside.

Tidal waves will slap against the coasts. People would be afraid of living on the coasts and would retreat from the coasts.

Most of coastal America will be submerged. [SEP]

Our ships will be vulnerable to attack by nature and adversary.

We would not be able to supply our 800 military bases overseas. Their supply lines would be abruptly cut.

Angel Touches Earth Axis

Cap had come across a recently released excerpt from the notebooks of Sister Lucy of Fatima. Sister Lucy wrote about the time in 1944 when she struggled to write down the secret. She felt the friendly hand of the Madonna upon her shoulder and then Sister Lucy was shown a vision. “The point of the flame-like lance which detaches, touches the axis of the earth and it [the earth] shakes: mountains, cities, towns and villages with their inhabitants are buried. The sea, rivers and clouds leave their bounds, they overflow, flood and drag with them into a whirlpool, houses and people in a number unable to be counted; It is the purification of the world from the sin it is immersed in. Hatred (and) ambition, cause destructive wars.”ⁱⁱⁱ

The vision describes an angel with a fiery lance who is sent to punish the world. The tip of the lance touches the axis of the planet and disturbs its rotation. Seas and lakes travel across the landscape. Storms whip the countryside. Violent winds topple houses and barns. Cities and peoples are swept away by the waters.

Cap was stunned to see the word “axis”. It confirmed what she had long suspected, that the earthquake would be caused by a change in the rotation of the earth. In the Gospels, it is written that the powers of heaven will be shaken. The Sun and the Moon will appear to shake in the sky. But, it is the Earth which will shake. The earth will wobble like a top so that the Sun appears to move back and forth.

Goodman reads the book which electrified Einstein.

Colonel Goodman came into the officer’s club one night in January 2024 carrying a briefcase. His companions looked forward to news from Hap. This was the moment they had been waiting for. It was like the unwrapping of a present. After hours of plowing through their routine tasks, now came something interesting. They called these sessions the “tour of the universe.”

Hap sat down and ordered a drink. He reached into his briefcase and pulled out a book. He passed it around for viewing. On its cover was a large picture of the earth. Mostly blue with swirling white clouds. The title was *Path to the Poles*.

“Back in the sixties, there was a professor named Charles Hapgood. During the Second World War, he worked for the predecessor of the CIA and later as a college professor. Hapgood theorized that Earth had experienced sudden crust displacements and the shifting of continents. Einstein was so impressed with Hapgood’s ideas that he wrote the foreword to one of his books. He wrote that Hapgood’s work “electrified me”.

“Hapgood believed that towards the end of the last ice age, around 10,000 years ago, large ice formations at the poles caused the outer crust to break loose and slip. The crust beneath Russia moved northward such that some temperate climate areas of Russia were suddenly thrust into the arctic. It was as if the cover of a baseball suddenly rotated around the interior.

As if on cue, the building vibrated from a small tremor. Plates and glassware clattered on the table. They had been having tremors for weeks.

“At this time, about 40,000,000 animals died in North America. Many suddenly became extinct, including mammoths, mastodons, giant beavers, sloths, woolly rhinos and saber tooth cats. Many of their bodies were flash frozen in the Siberian Tundra.

“Even in the last century, their bodies were still edible. Lydekker wrote for the Smithsonian in 1899 that entire carcasses were ‘as fresh as in frozen New Zealand sheep in the hold of a steamer. And sleigh dogs, as well as Yukuts themselves, have often made a hearty meal on mammoth flesh thousands of years old.’ A New York Herald Tribune reporter ‘remarked on the delicious flavor of some mammoth meat served to him at a dinner at the Academy of Sciences of Moscow in the 1930’s.’

“In one case, an explorer in the barren arctic wilderness found in the permafrost a well preserved 90-foot tree lying on its side. It had green leaves and fruit still on it’s branches. The presence of certain grasses and fruits in the mouths and stomachs of mastodons suggest that some powerful force had interrupted their grazing and that it had happened in August. In some places, heaps of bodies collected together. They were twisted and torn, entombed in great muck beds.

Hapgood believed that core samples showed that the north pole was once located over the Hudson Bay. And that the heavy accumulation of ice had depressed the landscape. When the pole moved again and the ice melted, the circular depression filled with water and became the Hudson Bay.

My take on it is that during one summer day about 10,000 years ago, mammoths were grazing in the fields of southern Russia. Suddenly, there was a great earthquake and the land mass bolted northward at high speed.

The mammoths tumbled over and over again. The land mass pushed into the Arctic Circle. The terrain was shattered and broken. The frigid waters of the displaced Arctic Sea swept over the land in a giant wave. The bodies were immediately frozen and sunk to the bottom. There is a saying that Lake Superior never gives up her dead. That is because cold bodies do not decompose, nor do they float. The mammoth bodies collected in low spots. Rapidly flowing waters damaged the bodies badly and stripped the land of topsoil. The sediment settled over the bodies and buried them for the next 10,000 years.

Hapgood spoke about the radical change in South America too. He said that 'Comparatively radical vertical changes in the position of land masses are evidenced by a considerable number of ancient beaches which are now found at great elevation above sea level and far inland from the present coasts.'

There are people who believe that every 10,000 years or so the earth gets misshapen due to the polar ice caps on the outside and magma movements on the inside. Then the crust slips. With the earth rotating at 700 miles per hour at our latitude, this would cause a real shake up. Hapgood never says so, but he implies that it could happen again.

The Oronteus Finaeus Map of Antarctica.

Hap then passed a map around the table. "There was another interesting item in the book. There is a map of Antarctica which was discovered by the map maker Oronteus Finaeus in 1531. The map now sits in the Library of Congress. The source of the map is not known. It is likely that it is a copy of a copy of a much older map. The question is how such a map could have been made. It was not possible to calculate longitude until the invention of the chronometer in the 1780's. Antarctica was not discovered until 1818 and was not mapped until the 1920's. Seismic

studies did not reveal the unglaciated coast until the 1950's. Yet, this map is not only accurate but it shows an Antarctica without an ice cap and glaciers.

Hapgood seems to imply that this map was made by some distant civilization at a time when

Antarctica was warmer and without glaciers, when it occupied a position further north before the crust slipped. That is to say about 10,000 years ago.

There was a moment of silence and then another tremor vibrated the room. Hap said that if the chair vibrated just a little stronger, it could do his back some good.

2024 The Earth Staggered. then the Great Earthquake

Cap sat at her desk in the second floor of the library. She had a strong sense that a great earthquake was just around the corner. She had the luxury of having a research assistant. She looked at the papers which the RA had prepared for her.

The Crust of the Earth.

The first page in the stack was about the crust. The continental crust averages about 25 miles in thickness. Beneath that is a layer called the mantle, which is solid but which can be viewed over long periods of time as being fluid. Granite is common in the crust, and the crust tends to float on the mantle. Cap considered the word float. Float was a word which brought to Cap's mind the image of a lone person on an ice flow. She imagined that she was standing on a 25-mile-thick table which floated on the hotter fluid materials far below. The temperature increases about 50 degrees with each mile of depth in the upper crust. In the lower half of the crust, the temperature increases about 25 degrees with each mile of depth.

Cap had explained her theories to her research assistant. After gathering data for her, he told her one day "I have been assembling data on this for weeks. I think that you better look up and not down if you want to understand quakes.

There is a professor Dr. Saumitra Mukherjee, a professor of geology & remote sensing at the School of Environmental Sciences at New Delhi. On the subject of Sunspots and Earthquakes, he has correlated a number of quakes to solar activity. He said that 'Geologists are afraid to say something ridiculous like "Sunspots cause earthquakes" despite the fact that in a certain sense they do.' The assistant enjoyed that phrase and the careful intelligence behind it. ^{iv}

The next page in Cap's stack was about the Heliosphere. Cap read while the assistant waited. The paper explained that the heliosphere is a vast region of space surrounding the Sun, a sort of bubble filled by the interplanetary medium and extending well beyond the orbit of Pluto.

Plasma blown out from the sun, known as the solar wind, creates and maintains this bubble against the outside pressure of the interstellar medium, the hydrogen and helium gas that permeates the galaxy. Although electrically neutral atoms can penetrate this bubble from the outside, the heliosphere is dominated by material which emanates from the Sun itself. Originating at the extremely hot surface of the corona, solar wind particles blast outwards at about a million mph.

At the distant edge of the heliosphere, the solar wind begins to interact with the interstellar medium. It slows down before finally ceasing altogether. The point where the solar wind becomes slower than the speed of sound is called the termination shock; the solar wind continues to slow as it passes through the Helios heath leading to a boundary called the heliopause where the interstellar medium and solar wind pressures balance.

The 'stagnation region' within the Helios heath was detected by Voyager I in 2010. The stagnation zone is located around 113 AU from the Sun. AU represents Astronomical Unit. One AU is the distance between the Earth and the Sun. So, the stagnation zone is located 113 times further than the distance between the Sun as the Earth. At 113 AU, the solar wind velocity drops to zero, the magnetic field intensity doubles, and high- energy electrons from the galaxy increase 100-fold.

Starting in May 2012 at 120 AU, Voyager 1 detected a sudden increase in cosmic rays. NASA announced that in late August 2012 Voyager 1, at about 122 AU from the Sun, entered a new region they called the "magnetic highway", an area still under the influence of the Sun, but with some dramatic differences. In the summer of 2013 NASA announced that Voyager 1 had crossed the border and entered the frontier of interstellar space.

Radio transmissions take 16 hours and 38 minutes to travel from Voyager 1 to antennas of NASA's Deep Space Network on Earth. The distance is 11.1 billion miles. Two telescopes aboard the 34-year-old spacecraft measure the number of charged particles. These particles were generated when stars in our galaxy exploded in supernovas.

We are still so new at this.

One project scientist said “When the Voyagers launched in 1977, the space age was all of 20 years old.... Many of us on the team dreamed of reaching interstellar space, but we really had no way of knowing how long a journey it would be - or if these two vehicles that we invested so much time and energy in would operate long enough to reach it.”

Oort Cloud

When Cap finished reading the RA’s paper about the heliosphere, he went on. “The Oort cloud is a formation of comets which encircle the solar system. The Oort cloud lies about 50,000 AU

away from the Sun, which is about a quarter of the distance to the nearest star which is Proxima Centauri. There are billions and billions of comets in the Oort Cloud. At any moment, the finger of God could touch one of these and send it toward us.

A Galactic Cloud of charged particles continues to push into the solar system. At the same time, solar wind is streaming out from the Sun. The radiation of solar wind has the capacity to damage human and plant cells. The magnetic field of the earth is helping to shield Earth from the solar wind. The magnetosphere is also shielding the earth from the charged particles of the incoming galactic cloud. If an increasing cascade of electrons continues to rain down on the earth’s atmosphere, there will come a time when the magnetic field is overwhelmed. The magnetic lines would be broken.

Reconnection.

“When magnetic lines reconnect at the center of the universe, the process can send off an enormous flare of X rays so strong that they travel across the galaxy, to be easily observable on Earth 27,000 light years away. When magnetic lines reconnect on the sun, the sun gives off solar flares or even fireballs.

“When the magnetic lines of the earth reconnect, the fluid inner layer of iron can surge enough to precipitate a movement of the crust. Like a man who trips in a store crowded with people and china, the crust of the earth, under enormous pressure, could buckle and break. One section after another would stumble like dominos. If that happens, the earth will stagger. It will be as if a giant held the earth in the palm of his hand, and then jiggled it. A shudder will pass through the earth. When the pressure reaches the surface, it will have the sound of a thousand freight trains.”

It will seem as if the ground had suddenly bolted out of position. In a second, it would jump to a position a thousand yards away. And then jump again another thousand yards. Cars will go

flying end over end. Houses would go tumbling down the street like boxes in the wind. Like a magician's trick gone wrong, when the table cloth sends all the dishes and silverware flying. High rises would find their foundations violently torn from beneath them.

Great tides will be set in motion, many times larger than tsunamis. Earthquakes will begin to shatter houses and topple buildings. All across the globe, bridges will collapse. Streets will tear. Water pipes will fracture. Cars tumble. Fields tip and lakes run free.

Cap sat back and said "When could this happen?" He said "It could happen at any time. The pieces are all in place." They sat in silence as Cap absorbed the possibilities of what the papers suggested.

Cap looked outside for a while and said "I think it will be December." The RA looked at her, "How do you figure that?" Cap said "It is working backwards. Next year, I believe that an unusual solar storm will brighten the sky on December 10. It will be the hundredth anniversary of the Madonna's request for the First Saturday Devotion. It happens on that date or close to it because the comet passes nearest at that time.

"The same logic works for the timing of the earthquake this year. On December 10th this year, the earth will be in the same position on the celestial clock as the same day next year. The comet is coming up from below. It will be nearest us on December 10th. At that time, the comet will exert its greatest strain upon the planet."

Cap pivoted in her chair and looked back out the window for a minute. Then a series of small shocks passed through the room. The building began to creak and moan.

It also dovetails with scripture. Speaking about the last times, Jesus said 'Pray that it does not come in winter.' We haven't prayed. It will come in winter.
